WHAT IS CLAIMED IS:

1. An image processing device comprising:

an image data memory for storing one or plurality of image data files in correspondence with at least any one of plurality of print sizes;

an image corrector for carrying out correction process for the one or plurality of image data files stored in the image data memory; and

an image data supply controller for controlling the one or plurality of image data files stored in the image data memory to be supplied to a printer so that each of the image data files is used for printing in a corresponding print size in accordance with the image data memory and an image data file in correspondence with a print size is prevented from being mixed with an image data file in correspondence with another print size.

2. An image processing device comprising:

an image data memory for storing one or plurality of image data files in correspondence with at least any one of plurality of print sizes;

an image corrector for carrying out correction for the one or plurality of image data files stored in the image data memory;

a print size memory for storing a print size for a printer; and

an image data supply controller for controlling an image data file in correspondence with the same print size as stored in the print size memory, of the one or plurality of image data files stored in the image data memory, to be supplied to the printer so as to be used for printing in a corresponding print size.

3. The image processing device according to claim 2,

wherein the image data supply controller controls an image data file in correspondence with a print size different from one stored in the print size memory, of the one or plurality of image data files stored in the image data memory, to be supplied to an auxiliary storage device, and

wherein further comprises an image data retriever for retrieving an image data file in correspondence with a print size stored in the print size memory after storage content thereof has been changed, of the image data file stored in the auxiliary storage device, and storing the image data file into the image data memory again.

4. The image processing device according to claim 2, further comprising a demanding signal output controller for controlling, when there exists an image data file which has not yet been supplied to the printer, a signal for demanding an operator to change storage content of the print size memory to be outputted.

5. A computer program product comprising:

an image data memory for storing one or plurality of image data files in correspondence with at least any one of plurality of print sizes;

an image corrector for carrying out correction process for the one or plurality of image data files stored in the image data memory; and

an image data supply controller for controlling the one or plurality of image data files stored in the image data memory to be supplied to a printer so that each of the image data files is used for printing in a corresponding print size in accordance with the image data memory and an image data file in correspondence with a print size is prevented from being mixed with an image data file in correspondence with another print size.

6. A computer program product comprising:

an image data memory for storing one or plurality of image data files in correspondence with at least any one of plurality of print sizes;

an image corrector for carrying out correction for the one or plurality of image data files stored in the image data memory;

a print size memory for storing a print size for a printer; and

an image data supply controller for controlling an image data file in correspondence with the same print size

as stored in the print size memory, of the one or plurality of image data files stored in the image data memory, to be supplied to the printer so as to be used for printing in a corresponding print size.

7. The computer program product according to claim 6,

wherein the image data supply controller controls an image data file in correspondence with a print size different from one stored in the print size memory, of the one or plurality of image data files stored in the image data memory, to be supplied to an auxiliary storage device, and

wherein further comprises an image data retriever for retrieving an image data file in correspondence with a print size stored in the print size memory after storage content thereof has been changed, of the image data file stored in the auxiliary storage device, and storing the image data file into the image data memory again.

8. The computer program product according to claim 6, further comprising a demanding signal output controller for controlling, when there exists an image data file which has not yet been supplied to the printer, a signal for demanding an operator to change storage content of the print size memory to be outputted.
